

KEMPRO LAC

Monocomponent transparent paint

FEATURES

KEMPRO LAC is a monocomponent paint based on acrylic resins, to be used as a transparent protective finish for metals.

There are several characteristics that make it an interesting product:

It can be applied directly on the surfaces, provided they are free from rust, grease and old paints, without it being necessary to prepare them with specific treatments or adhesives: it constitutes a complete painting cycle by itself.

Thanks to its basic components, it forms a particularly compact and continuous film that resists corrosive environments and is still very good on metal surfaces without altering their appearance.

It is the ideal covering for machinery, metal structures, pylons, cranes, construction machinery, railings and in general for those structures that must be outdoors or in particularly aggressive environments.

An important use of the product is found in the artistic crafts sector. The **KEMPRO LAC** can in fact be used to protect wrought iron or any other hand-worked metal to ensure that it retains its natural appearance over time without rusting or oxidizing.

HOW TO USE

KEMPRO LAC is extremely simple to use because, being a single component, it doesn't require any special mixing and can be applied, with good yields, by brush, spray or roller.

For any necessary dilutions in spray application (10-20%) a diluent for nitro or synthetic paints should be used.

The product is available in two versions:

→ **Glossy finish**

→ **Matte finish**

CHEMICAL/PHYSICAL DATA

Composition :	alkyd-polyurethane resin
Solvent	: white spirit or nitro
Specific weight	: 950 gr/lt
Drying	: 24 hours deep
